

BESS Daily Trading Performance Report — 2026-04-19

All six data streams have returned. Here is the synthesised operator report:

■ Inner Mongolia BESS Portfolio — Daily Trading Performance Review

****Date:**** 2026-04-19 | ****Generated:**** 2026-04-25 | ****Assets:**** suyou · hangjinqi · siziwangqi · gushanliang

Portfolio Overview

The portfolio generated a combined cleared-actual P&L of ****¥4,636,504 CNY**** on 2026-04-19, driven almost entirely by gushanliang (¥3,832,719) and hangjinqi (¥774,500), while siziwangqi contributed a modest ¥66,494 and suyou recorded a loss of ****−¥37,209****. All four assets had full ops-dispatch data ingested (96 rows each from `marketdata.ops\_bess\_dispatch\_15min`), confirming complete physical dispatch records for the day. However, a ****critical portfolio-wide data gap**** exists: the perfect-foresight (PF) hourly benchmark failed to solve for any asset (0 days solved across all four), meaning capture rates vs. PF and full attribution waterfall buckets cannot be computed today. Additionally, nominated dispatch P&L is unavailable for all assets from `canon.scenario\_dispatch\_15min` — ops nominations were sourced from the Excel ops file instead. All compensation rates defaulted to 350 CNY/MWh due to missing `core.asset\_monthly\_compensation` entries for April 2026. Forecast P&L figures (hourly, compensation-inclusive) are ****not directly comparable**** to cleared-actual P&L (15-min, market-only); directional gaps are noted but should not be treated as precise attribution.

Per-Asset Highlights

■ suyou

Strategy	P&L; (CNY)	Granularity
forecast_ols_da_time_v1 (best forecast)	+278,037	hourly
forecast_naive_da	+278,037	hourly
****cleared_actual****	****−37,209****	15-min

- ****Cleared-actual P&L;: −¥37,209 CNY**** — the only loss-making asset in the portfolio today. The forecast model suggests a positive opportunity existed (¥278k hourly, compensation-heavy), but the actual dispatch lost money on market prices, implying poor execution timing or adverse nodal price exposure.
- ****Ops dispatch data: ■ Full (96 rows)**** — physical dispatch records are complete; nominated dispatch P&L; not available from canon.
- ****Dominant loss bucket: Indeterminate**** — PF benchmark unavailable; full waterfall cannot be calculated. The large gap between forecast (+¥278k) and actual (−¥37k) is a ¥315k directional shortfall; root cause (forecast error, execution, or grid restriction) cannot be isolated without PF data.
- ****30-day realization status: ■■ No data**** — monitoring DB returned no snapshot; realization ratio cannot be quoted.
- ****Fragility level: ■■ No data**** — fragility monitor returned no snapshot.

■ hangjinqi

Strategy	P&L; (CNY)	Granularity
****cleared_actual****	****+774,500****	15-min
forecast_ols_da_time_v1	+278,037	hourly
forecast_naive_da	+278,037	hourly

- ****Cleared-actual P&L;: +¥774,500 CNY**** — best performing strategy on the day; actual 15-min dispatch significantly outperformed the forecast model (+¥496k gap vs best forecast, directional). This suggests the asset captured high intraday price spikes the hourly forecast model missed, or benefited from compensation. Market component was ¥295,000 with 1,370 MWh discharged.
- ****Ops dispatch data: ■ Full (96 rows)**** — complete. Nominated dispatch unavailable from canon.
- ****Dominant loss bucket: N/A**** — actual outperformed all modelled strategies; no loss waterfall applicable. Gap analysis direction is inverted (actual > forecast).
- ****30-day realization status: ■■ No data**** from monitoring DB.
- ****Fragility level: ■■ No data**** from monitoring DB.

■ siziwangqi

Strategy	P&L; (CNY)	Granularity
forecast_ols_da_time_v1 (best forecast)	+278,037	hourly
forecast_naive_da	+278,037	hourly
****cleared_actual****	****+66,494****	15-min

- ****Cleared-actual P&L;: +¥66,494 CNY**** — positive but well below the forecast model's compensation-driven estimate. Market component was only ¥9,636 on 162.5 MWh discharged, indicating low utilisation relative to asset capacity (200 MWh). The directional gap vs forecast is -¥211k, suggesting the asset captured limited price spread on this day.
- ****Ops dispatch data: ■ Full (96 rows)**** — complete. Nominated dispatch unavailable from canon.
- ****Dominant loss bucket: Indeterminate**** — PF unavailable; gap likely reflects a combination of low dispatch volume and modest market prices at this node. Consider whether grid restrictions suppressed throughput.
- ****30-day realization status: ■■ No data**** from monitoring DB.
- ****Fragility level: ■■ No data**** from monitoring DB.

■ gushanliang

Strategy	P&L; (CNY)	Granularity
****cleared_actual****	****+3,832,719****	15-min
forecast_ols_da_time_v1	+278,037	hourly
forecast_naive_da	+278,037	hourly

- ****Cleared-actual P&L;: +¥3,832,719 CNY**** — outstanding outperformance; the dominant contributor (83% of portfolio P&L;). Market component ¥1,509,069 + compensation ¥2,323,650 on a massive 6,639 MWh discharged — approximately ****33×** the energy throughput of siziwangqi** on the same day. This level of throughput is well above a typical 100 MW / 200 MWh asset's single-cycle capacity, indicating either multi-cycle operation, a larger asset rating, or an anomalous data point that warrants confirmation.
- ****Ops dispatch data: ■ Full (96 rows)**** — complete. Nominated dispatch unavailable from canon.
- ****Dominant loss bucket: N/A**** — actual far exceeds all forecast benchmarks. No attribution loss applicable; priority is to verify and validate the 6,639 MWh figure.
- ****30-day realization status: ■■ No data**** from monitoring DB.
- ****Fragility level: ■■ No data**** from monitoring DB.

Alerts & Flags

■ Monitoring System Gap — All Assets

The 30-day realization monitor and fragility monitor returned ****empty snapshots**** for all four assets on 2026-04-19. This means:

- No rolling realization ratio (cleared_actual / PF benchmark) can be quoted.
- No NORMAL / WARN / ALERT / CRITICAL status levels are available.
- No fragility scores (LOW / MEDIUM / HIGH / CRITICAL) or dominant factor narratives are available.

****This is a systemic data gap requiring immediate investigation.**** The monitoring batch job may not have run for this snapshot date, or the snapshot_date 2026-04-19 may be ahead of the latest computed

snapshot.

■■ suyou — Negative P&L; Day

- **Cleared-actual P&L:** -¥37,209 on a day where all other assets were profitable.
- Root cause unresolvable without PF benchmark data. Directional loss vs forecast: -¥315k.
- Manual review of the 15-min dispatch profile is recommended.

■■■ Perfect-Foresight Benchmark Failure — All Assets

- ``perfect_foresight_hourly`` returned 0 solved days for all 4 assets.
- This blocks: capture rate calculation, full attribution waterfall, `grid_restriction` and `forecast_error` bucket quantification.
- **Likely cause:** Missing actual RT price data for 2026-04-19 (all ``actual_price`` values are 0.0 in dispatch records — this is the proximate indicator).

■■ gushanliang — Anomalous Throughput

- Reported discharge of **6,639 MWh** in a single day.
- If the asset is rated 100 MW / 200 MWh, this implies ~33 full cycles — physically impossible.
- Could reflect a larger asset size not reflected in current metadata, a data ingestion error, or aggregated fleet-level reporting.
- **Flag for ops validation before this figure is used in any reporting or settlement reconciliation.**

Recommendations

1. **Investigate and restore the realization & fragility monitoring snapshot for 2026-04-19.** The monitoring batch job appears to have not produced any output for this date. Confirm the batch job ran, check ``reports.bess_asset_daily_attribution`` for any populated rows, and re-trigger if necessary. Without this, 30-day trend surveillance is blind.
2. **Diagnose why the PF hourly benchmark returned 0 solved days across all assets.** All ``actual_price`` values in dispatch records are 0.0, strongly suggesting that hourly actual RT price data for 2026-04-19 has not been loaded into the DB. Verify ``marketdata.md_rt_price`` (or equivalent) for this date and re-ingest if missing — this will unlock capture rate calculations and the full attribution waterfall.
3. **Validate gushanliang's 6,639 MWh reported discharge immediately.** Contact the ops team to cross-check against the physical settlement meter reads and the DA cleared energy report. If this is a data error, correct ``marketdata.ops_bess_dispatch_15min`` and ``canon.scenario_dispatch_15min`` before the figure propagates into monthly P&L; reporting. If it reflects a genuinely larger asset, update asset metadata accordingly.
4. **Conduct a deep-dive on suyou's -¥37,209 loss.** Pull the 15-min actual dispatch MW profile against the nodal RT price curve for the day. Determine whether the loss stems from charging at positive prices, discharging at negative prices, or forced curtailment. Cross-reference with the `id_cleared_energy` gap to assess whether BOP or grid constraints were binding.
5. **Upload April 2026 compensation rates to ``core.asset_monthly_compensation`` for all four assets.** The default 350 CNY/MWh was applied across the board — if actual rates differ materially, both the forecast-strategy P&L; and the cleared-actual compensation component will be misstated. This is especially material for gushanliang where compensation (at default rate) represents ~61% of reported P&L;.

> **■■■ Comparability Caveats:**

- > - Hourly forecast P&L; (compensation-inclusive) $\neq$ 15-min cleared-actual P&L; (market-only + compensation). Directional gaps are indicative only.
- > - ``nominated_dispatch_mw`` (■■■) $\neq$ ``cleared_energy_mwh`` from ``md_id_cleared_energy``. Ops nominations $\neq$ market-cleared volumes.
- > - Province-level DA price proxy used for forecasting; may diverge from asset-level nodal prices.
- > - ``ops.asset_outage_log`` not yet implemented — `asset_issue` attribution bucket is unavailable.
